イロト イポト イヨト イヨト

- Alphabet A_q with $q \in \mathbb{N}$ characters,
- Words: concatenations of characters, preferably of a fixed length n ∈ N
- Code *C*: collection of $M \in \mathbb{N}$ words
- If *C* is a *q*-ary code of length *n* (i.e. all words have length *n*), then $M \le q^n$.
- Hamming distance between two codewords: number of positions in which the two words differ.

fwo 🔀

Coding/Decoding

Let C be a code of length n.

- Minimum distance of C, d(C),
- determines the number of transmission errors that can be detected/corrected.

Fundamental problem of coding theory: construct codes with "optimized parameters".

Linear codes

- The alphabet A_q is the set of elements of a finite field 𝔽_q of order q, q = p^h, p prime, h ≥ 1.
- A linear *q*-ary code of length *n* is a subspace of 𝔽ⁿ_q.
- For a linear code *C*, its minimum distance equals its minimum weight.

The Singleton bound

Theorem (Singleton bound)

Let C be a q-ary (n, M, d) code. Then $M \le q^{n-d+1}$.

Corollary

Let C be a linear [n, k, d]-code. Then $k \leq n - d + 1$.

Definition

A linear [n, k, d] code *C* over \mathbb{F}_q is an MDS code if it satisfies k = n - d + 1.

fwo 🕉

Special sets of vectors

Lemma

An MDS code of dimension k and length n is equivalent with a set S of n vectors of \mathbb{F}_q^r with the property that every r vectors of S form a basis of \mathbb{F}_q^r , with r = n - k.

Definition – Examples

Definition

An arc of a vector space \mathbb{F}_q^r is a set *S* of vectors with the property that every *r* vectors of *S* form a basis of \mathbb{F}_q^r .

- Let $\{e_1, \ldots, e_r\}$ be a basis of \mathbb{F}_q^r . Then $\{e_1, \ldots, e_r, e_1 + e_2 + \cdots + e_r\}$ is an arc of size r + 1.
- ② Let $S = \{(1, t, t^2, ..., t^{r-1}) || t \in \mathbb{F}_q\} \cup \{(0, 0, ..., 0, 1)\} \subset \mathbb{F}_q^r$. Then *S* is an arc of size *q* + 1.

fwo Wrije Universiteit

A D > A B >

One of the first results

Theorem (Bush 1952)

Let *S* be an arc of size *n* of \mathbb{F}_q^r , r > q. Then $n \le q + 1$ and if n = q + 1, then *S* is equivalent to example (1)

From now on we may assume $r \leq q$.

One of the first results

Theorem (Bush 1952)

Let S be an arc of size n of \mathbb{F}_q^r , r > q. Then $n \le q + 1$ and if n = q + 1, then S is equivalent to example (1)

From now on we may assume $r \leq q$.

The (linear) MDS conjecture

Conjecture

Let $r \leq q$. For an arc of size n in \mathbb{F}_q^r , $n \leq q + 1$ unless r = 3 or r = q - 1 and q is even, in which case $n \leq q + 2$.

Questions of Segre (1955)

- (i) Given *r*, *q*, what is the maximal value of *l* for which an *l*-arc exists?
- (ii) For which values of $r, q, r \le q$, is each (q + 1)-arc in PG(r 1, q) a normal rational curve?
- (iii) For a given r, q, r < q, which arcs of PG(r 1, q) are extendable to a (q + 1)-arc?

Early results

In the following list, $q = p^h$, and we consider an *l*-arc in PG(r - 1, q).

- Bose (1947): $l \le q + 1$ if $p \ge r = 3$.
- Segre (1955): a (*q* + 1)-arc in PG(2, *q*), *q* odd, is a conic.
- q = 2, r = 3: hyperovals are (q + 2)-arcs.

more (recent) results

- Conjecture is known to be true for all $q \le 27$, for all $r \le 5$ and $k \ge q - 3$ and for r = 6, 7, q - 4, q - 5, see overview paper of J. Hirschfeld and L. Storme, pointing to results of Segre, J.A. Thas, Casse, Glynn, Bruen, Blokhuis, Voloch, Storme, Hirschfeld and Korchmáros.
- many examples of *hyperovals*, see e.g. Cherowitzo's hyperoval page, pointing to examples of Segre, Glynn, Payne, Cherowitzo, Penttila, Pinneri, Royle and O'Keefe.

fwo 🔀

more (recent) results

 An example of a (q + 1)-arc in PG(4,9), different from a normal rational curve, (Glynn):

$$\mathcal{K} = \{(1, t, t^2 + \eta t^6, t^3, t^4) \mid t \in \mathbb{F}_9, \eta^4 = -1\} \cup \{(0, 0, 0, 0, 1)\}$$

• An example of a (q + 1)-arc in PG(3, q), $q = 2^h$, gcd(r, h) = 1, different from a normal rational curve, (Hirschfeld):

$$\mathcal{K} = \{(1, t, t^{2^r}, t^{2^r+1}) \mid t \in \mathbb{F}_q\} \cup \{(0, 0, 0, 1)\}$$

Observations

Lemma

Let *S* be an arc of size *n* of \mathbb{F}_q^r . Let $Y \subset S$ be of size r - 2. There are exactly t = q + r - 1 - n hyperplanes of \mathbb{F}_q^r with the property that $H \cap S = Y$.

Corollary

An arc of \mathbb{F}_q^3 has size at most q + 2.

Theorem (Segre)

An arc of \mathbb{F}_q^3 , q odd, has size at most q + 1, in case of equality, it is equivalent with example (2).

DIUSSE

Tangent functions

- Let *S* be an arc of \mathbb{F}_q^r , choose an arbitrary ordering on the elements, |S| = n.
- Let *A* ⊂ *S* of size *r* − 2.
- Then there are t = q + r 1 n tangent hyperplanes on A to S.
- Let αⁱ be t linear forms on F^r_q such that ker(αⁱ) are these t tangent hyperplanes

Definition

For a subset $A \subset S$ of size r - 2, define its tangent function as

$$f_{\mathcal{A}}(x) := \prod_{i=1}^{t} \alpha^{i}(x)$$

Interpolation

Let *C* be a subset of *S* of size r - 1. Denote $d_C(x) := \det(x, C)$.

fwo Vrije Universiteit

・ロト ・ 同ト ・ ヨト ・ ヨト

Interpolation

Corollary

Let $A \subset E \subset S$, |E| = t + r. Then

$$\sum_{e \in E \setminus A} f_A(e) \prod_{u \in E \setminus (A \cup e)} d_{A,e}(u)^{-1} = 0$$

Segre's lemma

Lemma (S. Ball, [1])

Let S be an arc of \mathbb{F}_q^r . For a subset $D \subset S$ of size r - 3 and $\{x, y, z\} \subset S \setminus D$,

$$F_{D\cup\{x\}}(y)F_{D\cup\{y\}}(z)F_{D\cup\{z\}}(x) = (-1)^{t+1}F_{D\cup\{x\}}(z)F_{D\cup\{y\}}(x)F_{D\cup\{z\}}(y)$$

Theorem (Ball, [1])

Let S be an arc of \mathbb{F}_q^r , $r \leq q$. then

$$|S| \le q + r + 1 - \min(r, p)$$

The Segre product

Let
$$A \subset E \subset S$$
, $|E| = t + r$, define

$$g_A(x) := f_A(x) \prod_{u \in E \setminus (A \cup x)} d_{A,u}(x)^{-1}$$

Let *F* be the first r - 2 elements of *E* with respect to the ordering of *S*, define

$$\alpha_{\mathcal{A}} := \prod_{i=1}^{s} \frac{g_{D \cup \{z_{s}, \dots, z_{i}, x_{i-1}, \dots, x_{1}\}}(x_{i})}{g_{D \cup \{z_{s}, \dots, z_{i+1}, x_{i}, \dots, x_{1}\}}(z_{i})}$$

where $D = A \cap F$, $A \setminus F = \{x_1, \dots, x_s\}$ and $F \setminus A = \{z_1, \dots, z_s\}$. fwo $\bigvee_{\text{Universited}} \bigvee_{\text{Universited}} \bigvee_{\text{Brussel}} \bigvee_{\text{Universited}} \bigvee_{\text{Brussel}} \bigvee_{\text{$

The Segre product

Theorem

Let $E \subset S$, |E| = r + t. For any subset A of E of size r - 2,

 $\sum \alpha_{\textit{C}} = \textit{0}$

where the sum runs over the subsets C of E of size r - 1 containing A.

Theorem (Ball, DB [2])

Let S be an arc of \mathbb{F}_q^r , $q = p^h$, p odd, $r \leq 2p - 2$. then

$$|S| \le q+1$$

イロト イポト イヨト イヨト

Small dimensions

Consider the set $\{1, \ldots, n\}$. Define

- row indices: subsets of size *a* of {1,...,*n*}
- column indices: subsets of size *b* of {1,...,*n*}
- $I_n(a,b)$: matrix, has 1 in entry $(A,B) \iff A \subset B$ and 0 otherwise.

Define

$$T = \{i \mid 0 \le i \le b, {a-i \choose b-i} \ne 0 \mod p\}$$

fwo Vrije Universiteit

Small dimensions

Lemma (Wilson's formula for the *p*-rank)

If $n \ge a + b$ then the *p*-rank of $I_n(a, b)$ is

$$\sum_{i\in\mathcal{T}}\left(\binom{n}{i}-\binom{n}{i-1}\right)$$

MDS conjecture for $r \leq p$

Theorem

The MDS-conjecture is true for $r \leq p$.

MDS conjecture for $r \leq p$

Proof.

- We may assume that $r \leq \frac{|S|}{2}$
- Let |S| = q + 2, then t = q + r 1 n = r 3
- Let $M = I_{r+t}(r-1, r-2)$, then *M* is a square matrix.
- Let *v* be a vector with entry α_C at position *C*, *C* \subset *E*, |E| = r + t.
- Then vM = 0 (this is $\sum \alpha_C = 0$)
- But *M* has full rank when $r \leq p$ and $\alpha_C \neq 0$, a contradiction

fwo

slightly larger dimension

Generalize the "matrix approach"

- Let *G* be a subset of size r + t + m, m > 0.
- row indices: subsets $C \subset G$, |C| = r 1
- column indices: pairs (A, U), $U \subset G$, |U| = m, $A \subset E(U) := G \setminus U$, |A| = r - 2.
- entry (C, (A, U)) has value $\prod_{u \in U} \det(u, C)$.
- Call this matrix $M_{r-3}^{\uparrow m}$.

slightly larger dimension

Lemma

If v is a vector whose corrdinates are indexed by the subsets C of G of size r - 1 and whose C coordinate is $\alpha_C \prod_{u \in U} \det(u, C)^{-1}$, then $vM_t^{\uparrow m} = 0$

Lemma

If $r \leq 2p-2,$ there exists a vector of weight one in the column space of $M_{r-3}^{\uparrow 1}$

slightly larger dimension

Theorem (Ball, DB)

The MDS-conjecture is true for $r \leq 2p - 2$.

possible generalisations

we have actually observed that (for q odd)

- if r ≤ p, then M^{↑0} has full rank, which leads to a contradiction assuming the existence of a q + 2-arc,
- if $r \leq 2p 2$, then $M^{\uparrow 1}$ has full rank, which leads to the above conclusion again.

Computational results indicate that for odd q, and $r \le p + m(p-2)$, $M^{\uparrow m}$ has full rank. If this is the case, it could prove the MDS-conjecture for $r \le q/3$ (and hence also for $r \ge 2q/3$.
